Spellcheck Overview

Comparing against an array of dictionaries the SiteMorse Spellchecker highlights questionable words right down to the line in the code. Capable of learning new vocabulary specific to your organisation the Spellchecker combines various tools including Word Counts and searching for specified terms or phrases.

It is very important to note that the Spellchecker has no bearing on the overall score awarded to your site. Similar to the Inventory page the Spellcheck page is full of useful information concerning the quality of your site's language, without impacting the comparative score.

How the Spellcheck Works

The SiteMorse Spellchecker examines text returned to your site visitor. In addition to standard paragraph and table cells SiteMorse checks alternative image text, meta data and form value fields.

Although SiteMorse does not check the result of JavaScript code it does read between the <noscript> tags, checking the language quality seen by those browsers with JavaScript disabled. This text may be rarely seen by your content developers and can uncover hidden problems.

Currently the Spellchecker is limited to HTML files, we do not analyse the spelling in external files such as PDF documents and images.

Additionally, for your convenience SiteMorse ignores UK Postcodes and all web and email addresses.

Client Contributions

SiteMorse recognises not all words are found in a "dictionary". Therefore the Spellchecker is armed with a number of word lists, split into categories of company names, place names and recognisable words.

These lists are growing all the time as we come across new terms. The current contents can be viewed from the Word lists tab of your Site page at any time.

However, the power of the SiteMorse Spellchecker remains with you. Any word we "question" may be added to your own dictionary. Once you have marked it as correct we remove this word from the report, and ensure it will not be questioned again.

If you already have a word list in your organisation you can import this through the "Word lists" tab.

Limitations of Global Dictionaries

While we try to include many useful words in our global dictionaries we must exercise some discretion. Some words are so familiar we do not mind how they appear. For example few would argue the term "BBC" should be capitalised. But what about "RSS" or "UK".

Importing a great number of acronyms would ensure they are not marked as possible spelling mistakes. However they might mask real spelling mistakes. Take, for example, a Tropical Fish web site. Intending to label the title of the page as "CRAB AND FISH" the author mistakenly entered "CRB AND FISH".

CRB is a well known acronym for the Criminal Records Bureau. If we had added this to a global dictionary such an important spelling mistake would have gone unnoticed.

For this reason we encourage our clients to add such acronyms to their own private dictionary. We are, nevertheless, always looking to increase the number of words in our global dictionaries.

What is a filter?

Have you ever wondered how many times your company name appears on your site? Maybe you would like to know if all traces of your old office address have been removed. Perhaps a rebranding exercise has you trawling through every page on your site?

Filters make such tasks easy to achieve. As SiteMorse spell checks your site it sifts its way through the text. If it finds a word you are filtering for it highlights when and where it made the find, just like any other problem.

The number of filter matches is detailed on the spell check summary. You may then view every instance of a word, its URL, line number and parent tag.

Spellcheck Interface

The Spellcheck report tab appears alongside the others inside a report summary. This is the heart of the spellchecker.

View through the [spell checker](#) from SiteMorse.

Let us look at each part of this page in turn.

Why does it say I do not have permission to edit my report?

Up until the introduction of the spellchecker SiteMorse reports have been classified read only. Generally our clients only interacted with the site when requesting a new report or immediate test. The ability to configure word lists and modify the current report is unprecedented. To this end SiteMorse now enforce the permissions assigned when your account was created.

Owner

A site owner can make any changes they desire to the reports and word lists.

A shared site

A shared site in your account is read only. You may view the reports, but not make any changes.

A shared word list

Enhancing this arrangement the word lists may be shared with other users in your organisation.

Left hand side

Here we find two lists of URLs. The first ranks the top ten, from highest to lowest, of pages with the greatest questionable words. The latter lists the top ten wordiest pages. These lists quickly show which pages need the most attention. Click on their link to display the familiar page diagnostic view, listing all the problems detected with this page.

Right hand side

The right hand column contains further statistical information and various spellchecker configuration options.

“Frequently Encountered Words” lists the ten most occurring questionably spelt words found during the report.

Next to each word and its number of occurrences is an “add button”. This is your first invitation to interact with the report by indicating a word is not actually a misspelling.

Your attention should now be drawn to the statement above the table *“Your default dictionary selection is ‘Your word list’”*. This dictionary was automatically created for you to store words you are content with.

For example, has your company name appeared thousands of times? Names are unknown words but clearly for you these are not a spelling mistake. Add it here and the word will not appear in future reports. The word will not be removed from this list. Don’t worry if you add a word by mistake, we can remove it later.

Next useful Spelling Statistics point out the number of languages SiteMorse came across while testing your site. The current release is armed only with a British English dictionary.

The next two sections concern Word lists. First we see the names of dictionaries SiteMorse consulted during the test.

The second box identifies any filters in use during the report.

By default SiteMorse consults two dictionaries: ‘Place Names’ and ‘SiteMorse suggested words’. These contain the most frequently used non-dictionary words.

Lastly the spelling mistakes detected can be viewed through a traditional spellchecker interface – more on this later.

For now, click the “Add, edit or remove dictionaries” link under the Dictionaries Consulted section.

Shared Word lists - dictionaires and filters made available to your organisation				
Financial	Financial Terms & Jargon	Dictionary	<input type="checkbox"/>	<input type="checkbox"/>
Global Word lists - dictionaires and filters available to all				
Bad language	Highlight words on your site which may be considered rude or crude	Filter	<input type="checkbox"/>	
Companies and Organisations	Company names, brands and trademarks	Dictionary	<input type="checkbox"/>	
Place Names	Regional place names, including councils, cities and towns	Dictionary	<input type="checkbox"/>	
Public Sector	Central and Local Government terms	Dictionary	<input type="checkbox"/>	
SiteMorse suggested words	Common terms of use to all our users	Dictionary	<input type="checkbox"/>	

At this point it is worthwhile reiterating the use of dictionaries and filters within SiteMorse.

- Dictionaries are a collection of correctly spelt words ignored by SiteMorse during a report.
- Filters are a collection of words which for whatever reason need to be flagged up on detection. For example a list of offensive or otherwise banned words can be brought to your attention.

This page controls the creating and editing of such word lists. The table of word lists is split into three sections. **Your Word lists** are created by you and can be freely edited. **Shared Word lists** are the creation of another user “assigned” to you, you may view and depending on your level of access you may additionally edit these lists. **Global Word lists** have been collated by SiteMorse to get you started – listing many hundreds of commonly used terms not found in a standard dictionary.

The right hand controls determine the word lists to consult and the default dictionary. The selection of a default dictionary controls the “add” buttons found throughout SiteMorse. You may only choose from dictionaries you own or have permission to edit.

To include or exclude a dictionary tick the boxes in the left hand “use” column. When finished click the “update” button to store your selection.

Creating a word list

From the Word lists page click the link "Create a new private filter or dictionary" in the top right hand corner of the page.

Word lists consulted: dictionaries and filters

for www.dev.sitemorse.com

This page displays the dictionaries consulted by SiteMorse during a scan of www.dev.sitemorse.com. Global dictionaries are available to all our users collecting together frequently used non dictionary words. The site owner (and those with relevant permissions) may select any combination of dictionaries to be consulted during the next site test.

Private word lists offer the same features but are maintained by you. Store your department names, brands, office addresses or technical terms - each one will be ignored by SiteMorse. Alternatively to seek out a particular term, such as an old brand or employee create a filter, and let SiteMorse sift through the text for every occurrence.

Create a new Word list

Name:

Description:

Language: (Beta versions only supports British English)

List type: Dictionary - A list of words SiteMorse ignores while running your reports
 Filter - words SiteMorse will flag, regardless of spelling

[Logout](#)

[Privacy Policy](#) | [T&Cs](#) | ©2007 SiteMorse Technologies Ltd

This page requests the essential information needed to create a new word lists. Enter a name and description for ease of recognising the word list later. You can modify the languages this list applies to. For now only British English is in use, therefore leave the selection as "en-*" – all English variants.

Lastly select the type of word list, either dictionary or filter, as outlined on the previous page.

View and edit a Word list

After creating a new list or indeed at any time you wish to make a change, click on the title of a word list.

The result is a page displaying the various words (in alphabetical order) currently in the word list. If you are viewing a Global Word list or Shared list to which you only have read access the left hand column simply displays the words for you to see.

Those with edit permissions may remove an entry by clicking on the button next to the relevant word.

Reports Monitors **Word lists** Edit site Advanced configuration

Word lists consulted: dictionaries and filters for www.dev.sitemorse.com

This page displays a single word list. The contents of this list are listed below, you may remove words from and edit the settings of word lists you own, or have been granted permission to do so.

[Create a new private filter or dictionary](#)

SiteMorse follows various rules regarding capitalisation when spell checking a site:

- Any lowercase dictionary word may appear with an initial capitalisation (for example at the beginning of a sentence)
- Any word with unusual capitalisation (for example "SiteMorse") must appear exactly as entered in the dictionary.
- Any dictionary word may appear in uppercase, for example as a title.

Words in "A simple dictionary" list

[View administrator controls](#)

AA	remove

London	remove

Add a single new word

Once a word has been added to your word list it will be listed on the left.

Word:

Words added to this dictionary will not be reflected in current SiteMorse reports. You will be prompted to update when next visiting a report.

Import a list of words

Many organisations have already prepared a word list, for example that used by your word processor. SiteMorse is able to import any list of words, simply paste the list below, keeping to one word per line. Consult our Knowledge Base for advice on importing [Microsoft Office and other formats \(opens in a new window\)](#).

Separate one word per line:

Edit "A simple dictionary"

Name:

Description:

Language: (Beta versions only supports British English)

List type: Dictionary - A list of words SiteMorse ignores while running your reports
 Filter - words SiteMorse will flag, regardless of spelling

Adding Entries

Clients with the relevant access permissions to edit a list will see a second, right hand, column for editing the Word list.

Single Word

A single word can be entered at the top of the page. Spaces are not allowed.

Importing a list of words

You can import any list of words into a private word list you own or have write access to. More details overleaf.

Edit Word list details

Just like when creating the Word lists the Name, Description and Language setting can be altered. Additionally the Word list could change designation to act as a Filter for a specific scan, highlighting the correct words instead of ignoring them.

Importing from the Microsoft Office Suite

After clicking "Add to dictionary" in Microsoft Word or another Office application the word is placed in a custom.dic file.

Search for the dictionary

The simplest way to locate the file is by searching your computer. From the Start Menu select

Search >> Files and Folders.

Then type CUSTOM.DIC

Occasionally more than one file will be found. Simply open these in Notepad to determine the one you are after.

Locate the file through Word

If your dictionary has a different name, or is located on a network share you can find its path through Word. Firstly open Word, and select:

Tools > Options > Spelling & Grammar > Custom Dictionaries...

This displays a new dialogue, if more than one dictionary appears in the list select the one you wish to import. At the bottom of the dialogue window the full path to the CUSTOM.DIC file is displayed. Now open this file in Notepad.

Importing from Other Applications

Dictionaries can be imported from many applications who store word lists in a plain text file. Simply locate this file to begin.

Types of Word List

Microsoft Office dictionaries are straightforward. Each word is separated by a new line. SiteMorse imports in the same way.

Importing a List of Words

From the Word lists tab (see previous page) select the Word list you wish to edit. Assuming you have the relevant write permissions to this list you will see an additional right hand column with options to add a single word, import multiple words, or alter the word list settings.

It is this second option, to import multiple words that we paste our list of words into (one word per line). When ready click "Import list"

You will receive confirmation as to whether the add was successful. SiteMorse only allows the apostrophe to be used, other punctuation, including numbers and !"#\$%&()*+,-./:;<=>?@[\\]^_`{|}~ are not permitted. SiteMorse will also inform you if a word already exists.

View All Occurrences of a Word

In fact it is possible to click on a word at any time in the SiteMorse Spellchecker section to arrive at this page.

When deciding if a word is correct, or fixing the spelling mistake in the code, it is useful to see each and every occurrence. This display highlights the relevant word, the line number of the code and the tag the phrase was contained in.

Should the word be correct already you may add it to any of your dictionaries by selecting from the drop down box. Helpfully SiteMorse also displays the various spellings so that you add the right version to your word list.

The Spell Checker View

The spelling checker looks much more like the traditional spellcheckers we are all familiar with. Each word is presented in context. Above this the tag, line and page link are provided. On the right a count is shown, decreasing as you progress through the questionable words.

Unlike the other methods so far this page presents us with numerous options. A client with only a single dictionary is greeted with this display:

Tag: p Word: Natwest Line: 85 13 / 867
Page: <http://www.test.sitemorse.com/news.html?id=1248516027>

issue, and how they can have a quality, error free and well performing websites just like Britannia Building Society, **Natwest**, Capita, BT, TMP (monster.com) and British Airways by visiting <http://www.sitemorse.com>, where they can take a

- Natwest Exact match
- natwest Lower or title case
- NATWEST UPPER case

[Add to Your word list](#)
[Mistake corrected on site](#)

[< Previous](#) [Next >](#)

On the other hand clients with more than one dictionary are presented with a drop down list. Simply change the selection to add a word to a different list.

Tag: p Word: Natwest Line: 85 13 / 867
Page: <http://www.test.sitemorse.com/news.html?id=1248516027>

issue, and how they can have a quality, error free and well performing websites just like Britannia Building Society, **Natwest**, Capita, BT, TMP (monster.com) and British Airways by visiting <http://www.sitemorse.com>, where they can take a

- Natwest Exact match
- natwest Lower or title case
- NATWEST UPPER case

Your word list

[Add to Dictionary](#)
[Mistake corrected on site](#)

[< Previous](#) [Next >](#)

To move back and forth use the Next and Previous buttons.

Regardless of the number of dictionaries adding the correctly formatted word will reduce future workload. The rules of capitalisation, outlined earlier, are expanded through a simple selection process.

In this example the unknown word is "Natwest". Alternatives offered include the same word in lower and uppercase.

As "Natwest" is a name the initial capital is correct. Leave the selection as *Exact match* and click the Add button.

If the word were instead "Bank" the lowercase version "bank" should be added. Such a word is allowed with a small "b" in a sentence, or a capital "B" at the start of a sentence.

Lastly if the word were in fact a mistake which you have made the effort to correct on your site select the second button "Mistake corrected on site" to delete the error permanently from this report.

- Natwest Exact match
- natwest Lower or title case
- NATWEST UPPER case

[Add to Your word list](#)
[Mistake corrected on site](#)

The Page View

Similar to the list of frequently encountered words your default dictionary selection is displayed at the top of the Spellchecker section. Under these each word is listed, the tag each word was discovered in, an add button, the phrase in context, the line number and the status.

Clicking "add" inserts the corresponding word into your default dictionary, and removes all instances from this report. This page is redrawn and scrolled to where you were.

Updating the Spellchecker

As and when words are added to word lists reports become out of date. For example when SiteMorse staff add words to the global dictionaries or you attempt to view an old report the dictionaries consulted may have changed.

SiteMorse detects this and displays a warning message on the Spellcheck page:

SiteMorse Language Checks for your website

SiteMorse language and spelling tests evaluate the content of your site, checking against established dictionaries our reports allow you to identify potential mistakes and show you where to correct them. The SpellChecker does not contribute toward your Overall Mark.

Attention: Spellcheck configuration has changed since this report was run

Changes to the dictionaries consulted for this site have been made since this report was run. If you would like SiteMorse can upgrade this report to include the latest dictionary word lists, removing any words you have since added to your dictionary

- ◆ Your word list - **has been modified since this report was run**

[Update report with the changes in these dictionaries](#) **Warning** this action removes previously unknown words from this report and cannot be undone

[Add, edit or remove](#) word lists associated with this site. This will take you away from this report. To return simply click the Back button at the bottom of the Dictionaries and Filters page

Follow the instructions and click the "update" button to bring the report right up to date.

Appendix A - Specifying the language of content via the lang attribute

The lang attribute should be used to declare the main language of a document via the html tag and, where appropriate, to denote any change in language. This is helpful for screen readers and other assistive technology reading the page aloud as well as selecting the right dictionary for the SiteMorse spell checker to consult.

The lang attribute consists of a simple code, which is defined and maintained by IANA under the "Language Subtag Registry". This outlines a short language code which can be further refined by several criteria, including geographical region, for example:

lang="en-GB" : the British version of English

How to use the lang attribute:

When serving HTML you should use the lang attribute to declare the language of the document. For example, the following declares a document to be in Dutch:

```
<html lang="nl" >
```

When serving XHTML as text/html, you should use both the lang attribute and the xml:lang attribute. A British English site would use:

```
<html lang="en-GB" xml:lang="en-GB" xmlns="http://www.w3.org/1999/xhtml" >
```

If your language changes during the document you should mark the relevant section of text with the new language. For example:

```
<p>The French for <em>Cat</em> is <em lang="fr">chat</em>.</p>
```

SiteMorse will detect the change and consult the appropriate dictionary - if available.
